GY7702: Coursework 1

James A. Hardwick (179001497)

04/11/2020

Introduction

This document has been created to increase the **reproducibility** of this coursework assignment, written in RMarkdown. To support the reproducibility of the document please refer to the *GitHub data repository* for the commits that document the development of this Coursework 1

Libraries

This coursework use the library **tidyverse**

```
library(tidyverse)
```

Also the library **knitr**

```
library(knitr)
```

Other libraries are also used for specific question for instance in question 2 the library **palmerpenguins** these specific libraries will be referred to within each question

Questions

Question 1: Question 1 deals with a vector of 25 numbers between 1 and 7, with each value representing answers to survey questions. Some values are missing. Vector was defined by the question:

```
# vector survey_responses contains 25 elements
survey_responses <- c(NA, 3, 4, 4, 5, 2, 4, NA, 6, 3, 5, 4, 0, 5, 7, 5, NA, 5,
                      2, 4, NA, 3, 3, 5, NA)
```

```
# specify the survey_response variable
survey_responses %>%
  # using na.omit removes NA values from the vector
  na.omit() %>%
  # is. element will return logical output, if 7 or completely agree was answered in the
  # survey it will be returned as TRUE
  is.element(7) %>%
  # is. element will return logical output, if 1 or completely agree was answered in the
  # survey it will be returned as TRUE
  is.element(1)
```

Question 1.1:

```
##  [1] FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE
## [13]  TRUE FALSE FALSE FALSE FALSE FALSE FALSE FALSE
```

Question 1.2   Extract the indexes who at least somewhat agreed or more (values 5 to 7)

```r
# Function which see if any value between 5 and 7 and return the index of each
# survey participant
which(survey_responses %in% 5:7)
```

```
## [1]  5  9 11 14 15 16 18 24
```

###Question 2:   Question 2 looks data from Adélie, Chinstrap, and Gentoo penguins observed on islands in the Palmer Archipelago near Palmer Station, Antarctica. Palmerpenguins library can be found at *Palmerpenguins GitHub Repositry*

Question 2.1   Question 2.1 ask for the library (palmerpenguins) to be installed and loaded

```r
library(tidyverse)
library(knitr)
# install.packages("palmerpenguins")
library(palmerpenguins)
```

Question 2.2   Question 2.2 creates a table showing *species, island, bill length and body mass* of the 10 Gentoo penguins in the penguins table with the highest body mass

```r
# Starts from the entire palmerpenguins libraries
palmerpenguins::penguins %>%
  # Selects only the necessary columns
  dplyr::select(species, island, bill_length_mm, body_mass_g
  ) %>%
  # Retain only rows representing the Gentoo species
  dplyr::filter(species == "Gentoo"
  ) %>%
  # Sort by descending body mass in g
  dplyr::arrange(desc(body_mass_g))
```

```
## # A tibble: 124 x 4
##    species island bill_length_mm body_mass_g
##    <fct>   <fct>           <dbl>       <int>
##  1 Gentoo  Biscoe           49.2        6300
##  2 Gentoo  Biscoe           59.6        6050
##  3 Gentoo  Biscoe           51.1        6000
##  4 Gentoo  Biscoe           48.8        6000
##  5 Gentoo  Biscoe           45.2        5950
##  6 Gentoo  Biscoe           49.8        5950
##  7 Gentoo  Biscoe           48.4        5850
##  8 Gentoo  Biscoe           49.3        5850
##  9 Gentoo  Biscoe           55.1        5850
## 10 Gentoo  Biscoe           49.5        5800
## # ... with 114 more rows
```

Question 2.3   Question 2.3 creates a table with *average bill length per island*, ordered by *average bill length*

```r
# Starts from the entire palmerpenguins libraries
palmerpenguins::penguins %>%
  # Selects only the necessary columns
  dplyr::select(bill_length_mm, island) %>%
  # Grouped by island
  dplyr::group_by(island) %>%
```

```
# Drops rows containing NAs in the bill_length_mm column
# otherwise the mean function will return NA
dplyr::filter(!is.na(bill_length_mm)) %>%
# Calculates the average of bill_length_mm
dplyr::summarise(average_bill_length = mean(bill_length_mm)) %>%
# Ordered by descending average_bill_length
dplyr::arrange(desc(average_bill_length)) %>%
# kable improves tibble format
knitr::kable()
```

island	average_bill_length
Biscoe	45.25749
Dream	44.16774
Torgersen	38.95098

Question 2.4 Question 2.4 creates a table showing the *minimum, median and maximum* proportion between *bill length and bill depth by species*

```
# Starts from the entire palmerpenguins libraries
palmerpenguins::penguins %>%
  # Selects only the necessary columns
  dplyr::select(species, bill_length_mm, bill_depth_mm) %>%
  # Grouped by species
  dplyr::group_by(species) %>%
  # Drops rows containing NAs in the bill_length_mm column
  # otherwise the mean function will return NA
  dplyr::filter(!is.na(bill_length_mm))%>%
  # Drops rows containing NAs in the bill_depth_mm column
  # otherwise the mean function will return NA
  dplyr::filter(!is.na(bill_depth_mm)) %>%
  # Calculates the bill length to bill depth ratio
  dplyr::summarise(Proportion=
                  (bill_length_mm/bill_depth_mm)) %>%
 # using summariase again the minimum, median and maximum for each species can be calculated
  dplyr::summarise(min(Proportion),
                median(Proportion),
                max(Proportion)) %>%
  # Using the function kable formats the table
  knitr::kable()
```

species	min(Proportion)	median(Proportion)	max(Proportion)
Adelie	1.639810	2.136842	2.450000
Chinstrap	2.350516	2.661577	3.258427
Gentoo	2.566474	3.166667	3.612676

Question 3:

Question 3 looks at a topical data set of new and cumulative **COVD19** cases in the UK between March 1st and October 17th 2020. **COVID19** data is sourced from the HM Government Coronavirus in the UK

Question 3.1 Question 3.1 asks for the data covid19 cases to be loaded

```r
#using readr (part of tidyverse)
library(readr)
# reads the .CSV file with the correct directory
# Imports covid19_cases_20200301_20201017.csv and assings to a new variable
#covid_data
covid_data <-readr::read_csv("covid19_cases_20200301_20201017.csv")
```

Question 3.2   This question asked for an area specific table to be generated. Here **Brentwood** (Essex) COVID19 is presented. Brentwood Borough Council *(COVID19 response and information)[https://www.br entwood.gov.uk/index.php?cid=2937]*

```r
# create a complete table containing a row for each day and area, replace Na
# with the value available for the previous date
# Resulting table will be stored in the new variable
# brentwood_complete_covide_data
Brentwood_complete_covid_data <-covid_data %>%
  #selects extracts wanted columns
  dplyr::select(specimen_date, area_name, newCasesBySpecimenDate,
                cumCasesBySpecimenDate)%>%
  # group by specimen_data & area_name leads to each area_name having a row
  # per specimen data
  dplyr::group_by(specimen_date, area_name) %>%
  # tidyr :: fill replace NA values with the values from the previous row
  # default direction is down
  tidyr::fill(newCasesBySpecimenDate, cumCasesBySpecimenDate) %>%
  # replace_na replaces any remaining NA with 0
  tidyr::replace_na()%>%
  # dplyr :: filter subsets the area_name to Bentwood
  dplyr::filter(area_name == "Brentwood")%>%
  # converting to a data.frame as initially when trying to drop area_name using
  # dplyr::select (-area_number) got an error message 'adding missing grouping
  # variables error: area_number so I converted it to a data frame
  data.frame()%>%
  # then drop area_name using select
  dplyr::select(-area_name) %>%
  # Then converted back to a tibble
  as_tibble()
```

Question 3.3

load library lubridate

```r
library("lubridate")
```

```r
# start from copy Brentwood_day_before
Brentwood_day_before <- Brentwood_complete_covid_data %>%
  # mutate specimen_date using lubridate
  # format of ymd is specified then - 1 day
  # as.character converts date into character string
 dplyr::mutate(day_before = as.character(ymd(specimen_date - 1 ))) %>%
  # drop specimen_date and cumCasesBySpecimenDate columns
  dplyr::select(-specimen_date, -cumCasesBySpecimenDate) %>%
```

```
# Rename newCasesBySpecimenDate to newCases_day_before
dplyr::rename(newCases_day_before = newCasesBySpecimenDate)
# join Brentwood_day_before with Brentwood_complete_covid_data
# where specimen_date is equal to day_before using inner_join
```

Question 3.4   ###Question 4

Importing population per local authority and COVID19 case data

```
# import lad19_population data and assigned to a new variable LAD_pop
LAD_pop<- readr::read_csv("lad19_population.csv")
# import COVID19 case data and assigned to a new variable LAD_covid_cases
LAD_covid_cases <- readr::read_csv("covid19_cases_20200301_20201017.csv")
```

Carrying out table join for LAD_pop and LAD_covid_cases

```
# need to rename LAD_pop column lad19_area_name to area_name to match
# LAD_covid_cases table
covid_cases_lad_pop <- dplyr::rename(LAD_pop,area_name = lad19_area_name) %>%
# table join between LAD_pop and LAD_covid_cases
dplyr::left_join(LAD_covid_cases, LAD_pop, by = "area_name")
```

####Description and Interpretation
